

TSL unveils new products at BCA2009

TSL, located at **booth 7H2-01**, is unveiling the following products at BroadcastAsia2009.

Multichannel audio monitoring: The PAM1-3G8 is a comprehensive and compact multichannel

and Dolby D&E audio-monitoring product. TSL says not only does this 1RU unit support all standards up to and including 1080p 60Hz, it also allows comprehensive monitoring of a discrete 5.1 or Dolby-encoded audio signal from either AES or HD/SD sources.

Standard features include eight bar-graphs, Dolby metadata display, loudness indication, internal loudspeakers, stereo down-mix capability, incoming video display and the ability to control a set of external surround-sound speakers, all in a 1RU chassis. The PAM1-3G8 is very easy to operate and employs factory and user-definable presets that are recalled at the touch of a button.

Power manager mains distribution units (MDU series): TSL's new MDU12-PMi is a system and energy management solution that gives the user complete control over and visibility of equipment racks — no matter how geographically spread their locations. With power measuring plus remotely-switchable outputs, TSL says the new MDU12-PMi can play a central role in the conservation of energy in new broadcast installations.

Under monitor displays (UMDs) and tally: TSL unveils the new TallyMan TM2 Plus, the latest version of the company's TallyMan. This new product offers the security of twin power supply units and built-in relay tally control and UMD management system.
