

# Touchmix monitors & mixes audio

According to TSL, all the products from its audio monitoring unit family derived as ideas to solve a real problem brought to TSL by customers who could not find solutions for particular requirements.

In the case of TSL's new AVM-T-MIX audio mixer, or Touchmix, the request came from a renowned British broadcaster who wanted a rack-mount monitoring unit that could de-embed audio from one or two SDI signals simultaneously, and mix the

demuxed audio with AES and analogue signals from various sources.

TSL said the concept of a rack-mount audio mixer is not new. But what differentiates the Touchmix, it added, is the combination of a broadcast audio monitoring unit with a simple-to-use hands-on audio mixer. The Touchmix can act as a mixer, an audio monitoring unit, or a combination of both.

Martin Dyster, business development

**The Touchmix audio mixer acts as a mixer, an audio monitoring unit, or a combination of both.**

manager of TSL, elaborated: "We developed the Touchmix for a major broadcast project in the UK, which specified the operational capabilities when at the time there was nothing on the market which

could do it. We took that specification and developed it a little further, creating a product which we think will really excite the market when they delve into what it can do."
