

TSL in control of Tallyman

TSL has introduced TallyMan UMD and Tally studio control system, the latest TM1 and TM2 system controllers and the heart of a Tallyman system that runs the TallyMan program as an embedded Windows application. This allows realtime control of the system. TallyMan systems are available from low cost entry-level systems with everything in one box right up to large scale systems with several controllers and associated peripherals networked together. Additions to the range include the ESP-1R system expander, which extends the serial and parallel connections.
