

Comprehensive monitoring of all TSL products

TSL PROFESSIONAL has released the PsiMon SQL server-based system, which it describes as providing comprehensive alarm, control and energy monitoring of all TSL PDU products, deployed into broadcast installations.

Features of the budget-conscious system include 'ultra-fast' error reporting, and accurate numerical energy readings for parameter values where a single click advances the user straight to where the problem lies.

The ability to view Power Factor, voltage, current and temperature and real-time alarm status monitoring is also included, as is analysis of hundreds of mains distribution units.
