

TSL AMU HD range, In-Monitor-Display system

When migrating SD audio and video monitoring to HD, TSL's AMU range helps out with built-in video monitoring quality which enables monitor-quality downconversion of HD video signals of any standard resolution.

The all-new In-Monitor-Display system allows dynamic UMD information and dual tallies to be displayed directly in-picture on flat screen monitors. The system is a fully-integrated TallyMan addition and provides a new monitoring option somewhere between multiviewers and traditional separate UMD's.
