

TSL MONITORS AUDIO

TSL will showcase its latest branded products at Broadcast Asia 2010. The PAM2-3G16 and PAM1-3G8 are multi-standard, multi-format audio monitors designed to simplify multi-channel audio monitoring. Both units also now include Dolby Digital Plus as well as ITU-R BS.1770 loudness measurement capabilities.

Targeted for use primarily in master control rooms, the PAM2-3G16 offers a range of user-selectable scales, ballistics, and input/output signals along with the ability to dissect and monitor any multi-channel audio signal structure

The PAM1-3G8 is a 1RU box designed for applications where space is limited, but where the user still needs to be able to affirm that all multi-channel or Dolby audio streams are present. It offers 15 user configurable and instant recall monitoring presets, multiple signal format handling and user selectable bar graph characteristics.

Another solution, the MDU12-PMi, is a system and energy management solution that provides the user with control over equipment racks. The MDU12-PMi monitors the power consumption and operating temperature of racks, providing clear warnings if variables rise above or fall below programmable limits.
