

TSL adds AMU HD range

Jul 20, 2006 8:00 AM

TSL will show the latest in its expanding range of broadcast systems products, including the AMU HD line, at IBC2006.

The AMU HD range offers solutions to migrate existing SD audio and video monitoring to HD. The AMU2 8HD range monitors eight channels of HD/SD embedded audio, Dolby E and Dolby Digital in one box.

TSL's new In-Monitor-Display (IMD) system allows dynamic UMD information and dual tallies to be displayed directly in-picture on flat-screen monitors. The system has been designed as a fully integrated addition to the existing TallyMan system.

New additions to the TallyMan UMD and Tally studio control system include the ESP-1R system expander, which extends the number of serial and parallel connections.
